Submission – 20th Oct

AWS SRE Lab: Generating and Analyzing a System Performance Report

• Lab Overview

This lab is designed to allow learners to **generate and analyze system performance reports** on AWS. It will involve deploying an application, monitoring its behavior, capturing logs and metrics, and analyzing faults, bottlenecks, and anomalies. The goal is to **identify system performance issues and document a comprehensive report with insights and remediation recommendations.**

Objective:

1. Deploy an application on **AWS EC2 or EKS**.
2. Set up **CloudWatch monitoring** for logs and metrics.
3. Generate an **incident report** capturing CPU, memory, network latency, and error logs.
4. Perform **Root Cause Analysis (RCA)** on faults identified.
5. Document **remediation recommendations** for improving reliability.

Lab: Complete the lab as per this <https://www.eksworkshop.com/docs/introduction>

<https://www.eksworkshop.com/docs/fundamentals/>

- **Submission of Findings**

Report Submission Format

Your final deliverable should include:

- **Executive Summary:** Brief description of findings.
- **Fault Identification:** Key performance issues observed.
- **Performance Bottleneck Analysis:** Metrics supporting findings.
- **Root Cause Analysis (RCA) Report:** Breakdown of system behavior.
- **Remediation Action Plan:** Steps to prevent recurrence.
